INTRODUCTION:

- Educational institutes generate a large volume of data annually across various departments—academic, research, finance, infrastructure, and extracurricular activities. Preparing a comprehensive and accurate annual report from this data is often time-consuming, inconsistent, and manual.

❑ OBJECTIVE:-

- Streamline Data Collection
- Ensure Data Accuracy
- Enable Role-Based Access
- Facilitate Collaboration
- Improve Efficiency
- Support Data Insights
- Automate Report Generation

❑ PROBLEM STATEMENT:-

- ❑ Develop a portal of a student to streamline data collection and generate accurate, consistent annual reports for educational institutions.

Modules :

- User management module
- Activity submission module
- Machine learning image verification module
- Admin review module
- Database module
- Report generation module
- Notification module

Software Requirments:

- Frontend Development: Code Editor: VS Code /netbeans Framework: React.js Browser: Chrome / Firefox (for testing)
- Backend Development: Language: Python (Flask / Django) or Node.js Package Managers: pip / npm
- Database: MongoDB (if NoSQL flexibility is required)
- Machine learning: Dataset: Kaggle NLP: text processing

Hardware Requirements:

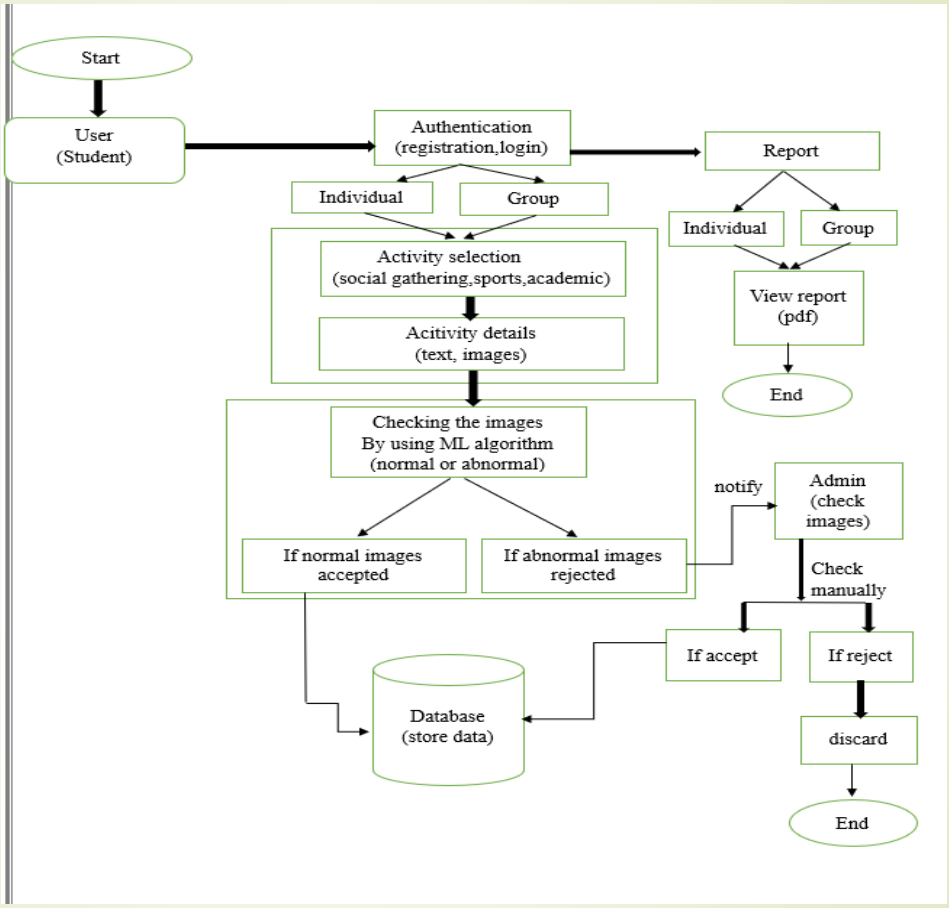

Component	Minimum Specification
Processor(CPU)	Intel i3/ AMD Ryzen 3
RAM	4 GB 8 GB or more
Storage	256 GB HDD/SSD
Display	13" or larger Full HD Monitor
Internet	Stable broadband connection

Applications:-

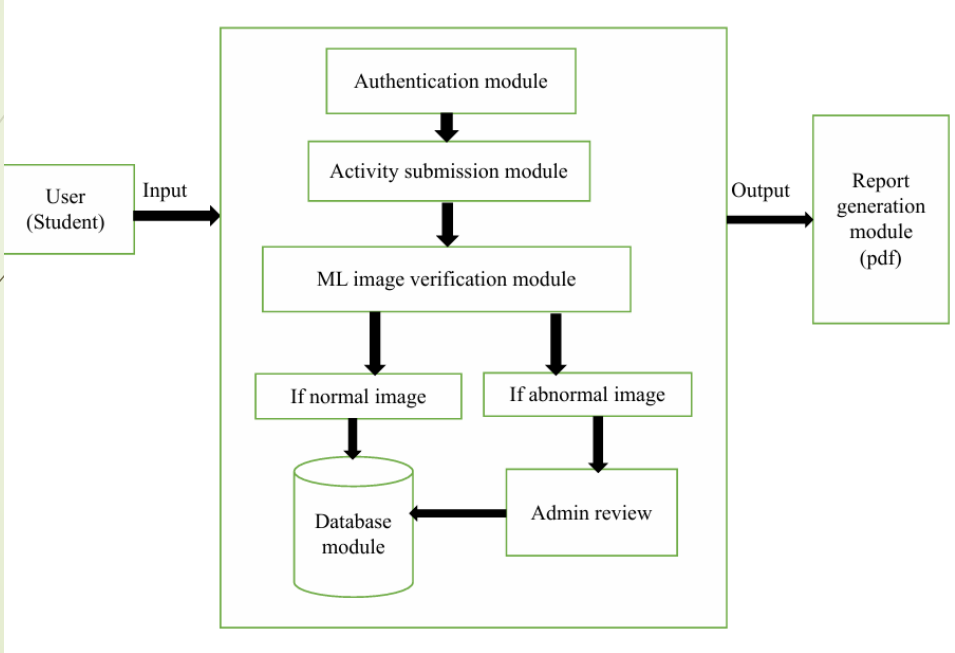

- Institute Annual Reporting: Digitally generate comprehensive annual reports showcasing academic, research, and administrative performance.
- Departmental Performance Tracking: Allow each department to track its yearly activities, achievements, and growth metrics
- Accreditation & Compliance: Simplify data collection for accreditation bodies (e.g., NAAC, NBA) by providing accurate, ready-to-use reports
- Event & Achievement Documentation: Maintain a structured digital record of student, faculty, and institutional achievements.
- Student Contributions: Allow students to share research, projects, and awards that directly feed into reports.
- Centralized Data Repository: Serve as a single source of truth for institutional data that can be reused for brochures, websites, and proposals.

Feasibility Study:

- The feasibility study evaluates the technical, operational, and economic aspects of EduReport.
- Technically, the project is feasible as the required technologies (React, Python/Django/Flask, MongoDB, ML frameworks) are readily available.
- Operational feasibility is ensured since institutes already collect such data and users are familiar with web portals.
- Economically, the system reduces manual workload and long-term costs, making it cost-effective.

Project Scope:

- Project Scope: Annual Report Preparation Portal
- The project scope includes designing and developing a user-friendly, efficient, and robust portal for preparing annual reports for educational institutes.
- The portal will facilitate:1. Data collection and integration
- 2. Data analysis and visualization
- 3. Report generation
- 4. Collaboration and feedback
- 5. User authentication and role management
- The portal will be scalable, adaptable to different types of educational institutes, and capable of handling large volumes of data.

SRS: Functional Requirments

- 1. User Authentication and Role Management
- 2. Data Collection and Integration
- 3. Data Analysis and Visualization
- 4. Report Generation
- 5. Collaboration and Feedback

SRS : non functional requirments

- 1. Performance
- 2. Security
- 3. Scalability

Thank You!
